1	1.	A memory to contain program and system information protocol (PSIP) data
2	about	digital television (DTV) content, the memory being organized to contain a data
3	struct	ure comprising at least one of

an information type descriptor segment and an extended information descriptor segment

each of which characterize extra information associated with a virtual channel or an event in a DTV data stream.

- 2. The data-structured memory of claim 1, wherein each of said information type descriptor segment and said an extended information descriptor segment includes:
  - a descriptor tag segment;
  - a descriptor length segment; and
  - an information type identification segment.
- 3. The data-structured memory of claim 2, wherein said descriptor tag segment has a value of 0xC9 for said information type descriptor segment and a value of 0xC8 for said an extended information descriptor segment.
- 4. The data-structured memory of claim 2, wherein said descriptor length segment indicates a remaining length of said information type descriptor segment as determined by said information type identification segment, said information description length segment and said information description segment.
- 5. The data-structured memory of claim 2, wherein said information type identification segment contains a code that characterizes said information associated with a virtual channel or an event in a DTV data stream as one of:
- 4 a GIF-formatted image file;
- 5 a JPEG-formatted image file;
- 6 a TIFF-formatted image file;
- 7 an ASCII text file;
- 8 an HTML-formatted text file;

	9 an XML-formatted text file;		
10 a basic audio formatted file having a .au file extension			a basic audio formatted file having a .au file extension;
	11		an MPEG-formatted audio file;
	12		a WAV-formatted audio file;
	13		an MPEG-formatted video file;
	14		a Quicktime-formatted video file;
	15		an AVI-formatted video file; and
	16		a user-defined formatted file.
	1	6.	The data-structured memory of claim 2, wherein said information type
	2	descri	ptor segment further includes:
	3		an information description length segment; and
the second second	1		an information description text segment.
mer year	1	7.	The data-structured memory of claim 6, wherein said information description
State Spires Spires	2	length	segment identifies a length of said information description text segment.
		8.	The data-structured memory of claim 6, wherein said information description
m/a /m	2	text s	egment includes text that characterizes said information associated with a
the first first offer the first first	3	virtual	channel or an event in a DTV data stream.
	1	9.	The data-structured memory of claim 8, wherein said information type
	2	identif	ication segment includes a code description corresponding to said text
	3	descri	ption in said information description text segment.
	1	10.	The data-structured memory of claim 2, wherein said extended information
2 descriptor segment further includes at least two of:		descri	ptor segment further includes at least two of:
	3		an information expected usage segment;
	4		an information location length segment; and
	5		an information location text segment.
	1	11.	The data-structured memory of claim 10, wherein said information expected
	2	usage	segment includes at least one of:

3 a first field that describes a usage of said extra information anticipated by a 4 creator of said extended information descriptor segment; a second field that describes said extra information as being an advertisement 5 6 or not; and 7 a third field that describes a location on a display screen where said creator of 8 said extended information descriptor segment anticipates that a representation of 9 said extra information should be positioned. 1 12. The data-structured memory of claim 11, wherein said first field describes said 2 extra information as one of: 3 undefined so as to have no expected usage; 4 extended event, extended programming guide (EPG) information that is to be **5** displayed during an EPG display when an event is selected; 6 extended event selected information that is to be displayed when an event is 17 selected; 18 extended channel EPG information that is to be displayed during an EPG 9 display when a channel is selected; 10 11 extended channel selected information that is to be displayed when a channel is selected; and 12 user-defined information. 1 1 13. The data-structured memory of claim 10, wherein said information location 2 identifies a remaining length of said extended information descriptor segment as 3 determined by said information location text segment. 1 14. The data-structured memory of claim 10, wherein said information location 2 text segment represents a string of text that is interpreted as a universal resource 3 locator (URL).

15.

data program within said DTV data stream or data external to said DTV data stream.

The data-structured memory of claim 14, wherein said URL is a reference to a

1 16. The data-structured memory of claim 15, wherein the external data is from the 2 world wide web (WWW). 17. The data-structured memory of claim 15, wherein said data program within 1 2 said DTV data stream is referenced with a path beginning as 3 dtv:/ 4 or, said data from the world wide web (WWW) is referenced with a path 5 beginning as 6 http:// 7 or 8 http://www. The data-structured memory of claim 1, further comprising a link between said 18. 1 4 distriction of the state of an information type descriptor and at least one of a virtual channel table (VCT) and an event information table (EIT). 1 The data-structured memory of claim 1, further comprising a link between said 19. 2 extended information descriptor segment and at least one of a virtual channel table 3 (VCT) and an event information table (EIT). 1 The data-structured memory of claim 11, wherein said first field describes said 20. 2 extra information as being at least one of: 3 intended to be displayed during a displaying of an EPG; and 4 intended to be displayed independently of a displaying of an EPG. 1 21. The data-structured memory of claim 11, wherein said third field describes 2 said location as being one of: 3 undefined so as to have no expected location; in the background relative to information of greater priority on said display 4 5 screen; 6 the upper left quadrant of said display screen; 7 the upper right quadrant of said display screen; 8 the lower left quadrant of said display screen; and

, t ·

- 1 22. A method to generate program and system information protocol (PSIP) data
- 2 about digital television (DTV) content, said PSIP data including at least one data
- 3 structure as defined in claim 1.
- 1 23. A program and system information protocol (PSIP) generator to generate
- 2 PSIP data about digital television (DTV) content, said PSIP data including at least
- 3 one data structure as defined in claim 1.

) (a .

- 1 24. The PSIP generator of claim 23, wherein said PSIP generator is embodied on
- 2 a computer running software.
  - 25. The PSIP generator of claim 24, wherein said software is written in the language Java.
  - 26. A computer-readable article of manufacture having embodied thereon software to generate program and system information protocol (PSIP) data about digital television (DTV) content, said PSIP data including at least one data structure as defined in claim 1.
  - 27. A method to generate an extended programming guide (EPG) display about content in a digital television (DTV) stream of data packets, said method comprising:
  - receiving said DTV stream of data packets, said stream containing program and system information protocol (PSIP) data;
  - recognizing at least one data structure, as defined in claim 1, within said PSIP data; and
- generating said EPG display as a function of said at least one data structure.
- 1 28. A digital television (DTV) receiver embodying the method of claim 27.

- 1 29. The DTV receiver of claim 28, wherein at least part of said DTV receiver is
- 2 embodied on a computer running software.

) () .

- 1 30. The DTV receiver of claim 29, wherein said software is written in the language
- 2 Java.
- 1 31. A computer-readable article of manufacture having embodied thereon
- 2 software to perform the method of claim 27.
- 1 32. A digital television (DTV) bit stream containing program and system
- 2 information protocol (PSIP) data describing content of said DTV bit stream, the PSIP
  - data being organized to contain a data structure comprising at least one of
    - an information type descriptor segment and
    - an extended information descriptor segment

each of which characterize extra information associated with a virtual channel or an event in a DTV bit stream.
